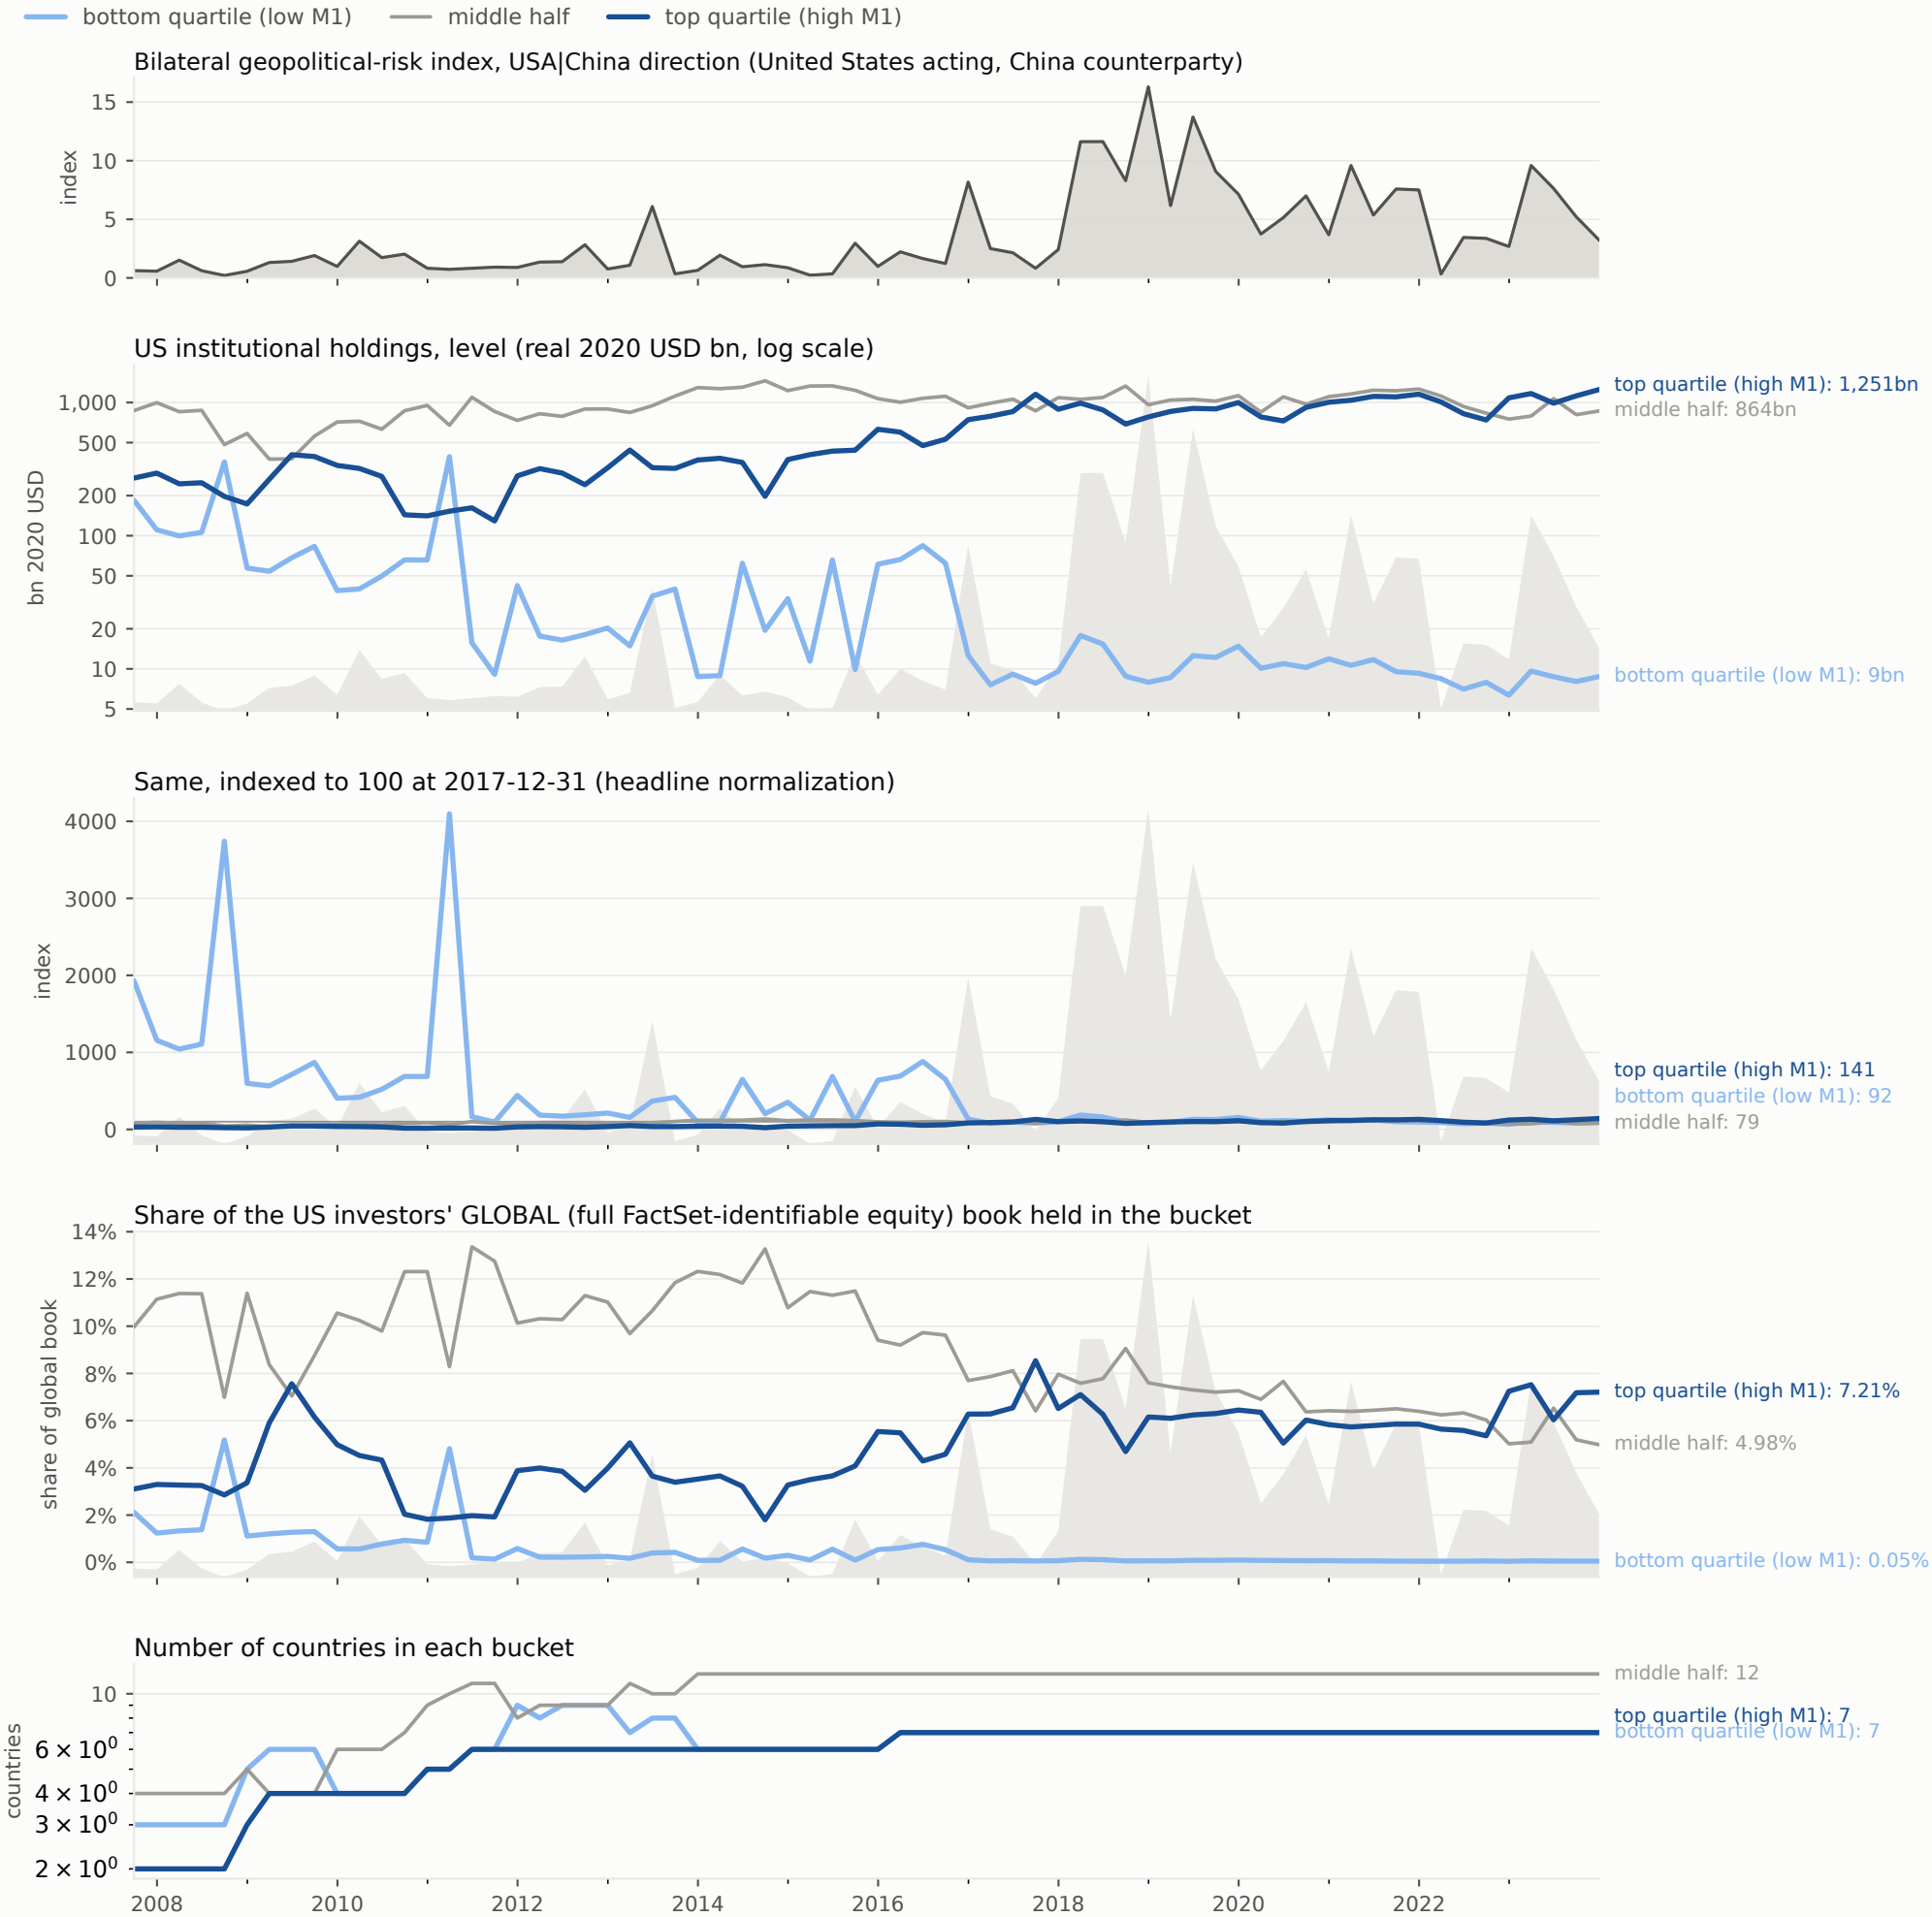
Figure A (country level). US holdings by country China-exposure quartile

Countries split on M1, measured at t-1



Countries are ranked each quarter on M1, the country-aggregate China link share (sum of China customer+supplier links / sum of all customer+supplier links, ownership-matched universe), then split at the cross-country 25th and 75th percentiles. TIMING: the ranking uses M1 at t-1; holdings are measured at t. Countries with fewer than 20 firms in a quarter are not rankable and are dropped that quarter, so the three lines need not exhaust the book. The level panel is on a log scale because the two arms differ by roughly two orders of magnitude in raw dollars -- a mechanical size difference, which is exactly why the indexed and share panels are the headline. READ THE PRE-2017 BOTTOM-QUARTILE LINE WITH CARE: the pre-2017 arms are far more sensitive to a single country than the post-2017 ones (under M1: 2.5 countries change bucket per quarter through 2016 and 2.3 afterward, so turnover itself is flat; but the bottom quartile holds only 6-7 countries, so when Spain crosses the 25th-percentile cut in 2015Q2 it alone moves that arm from 119 to 687 index points), so single large countries crossing a percentile cut can move an arm sharply. The quarter-by-quarter composition (per measure) is in fig_A_country_bucket_membership.csv. The share panel uses the GLOBAL (full FactSet-identifiable equity) denominator, the same denominator as the main regression; the EU-book version of the series (share_of_book_eu in fig_A_country_buckets.csv) is the within-Europe reallocation diagnostic and is not plotted. Background silhouette = Bilateral geopolitical-risk index, USA|China direction (United States acting, China counterparty), scaled to panel height with no axis and no ticks; read its level off the top panel.
