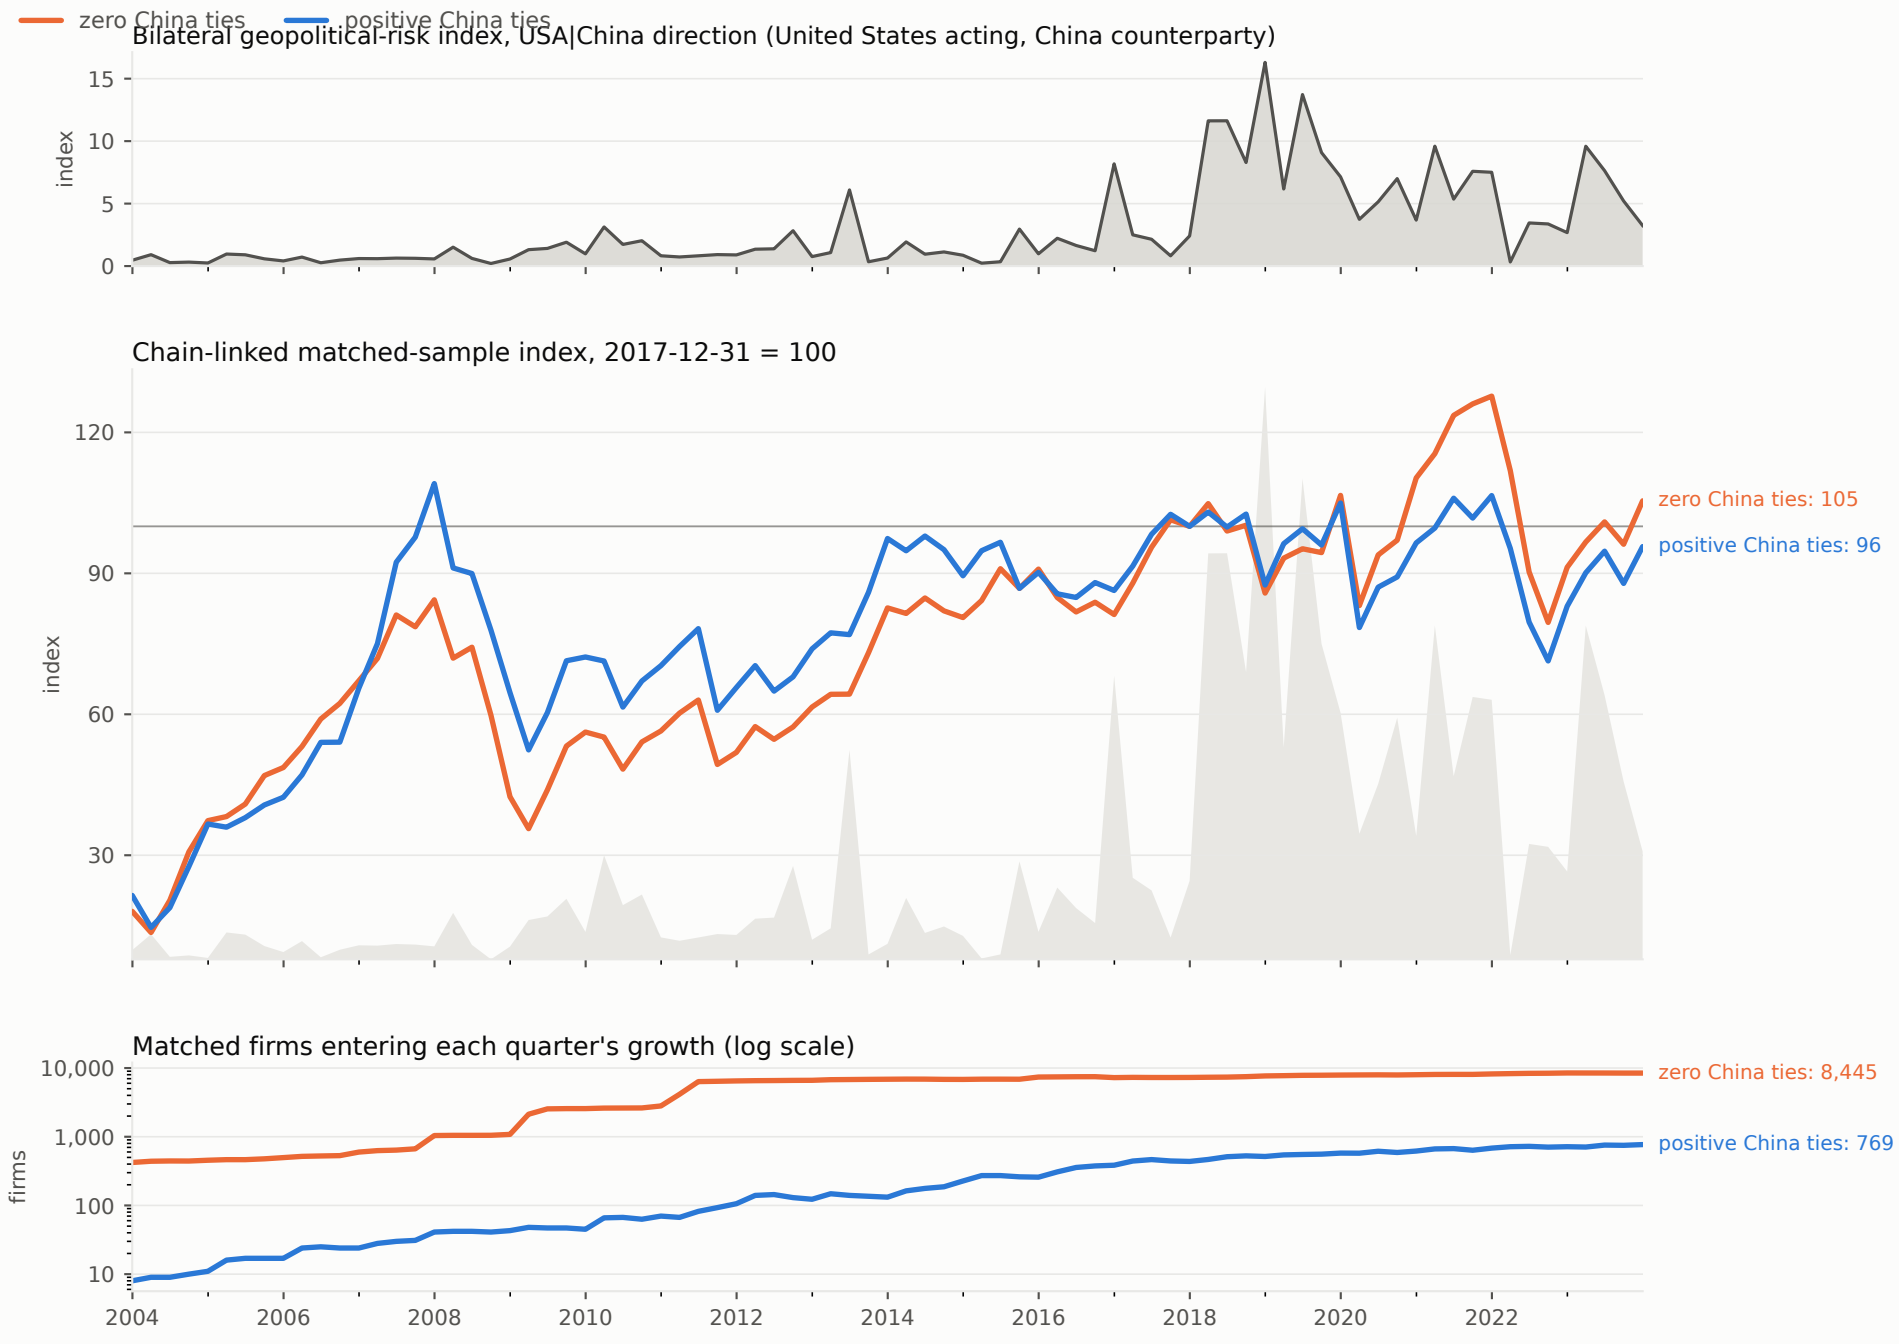
Figure A. US holdings of European firms, by China-link exposure

variant (i), composition control: chain-linked matched sample



Composition control WITHOUT a freeze date. For each quarter t and each arm, growth is computed only over firms present in t-1 and t AND classified in the same arm (on CN at t-1) at both dates; quarterly growth rates are then chained. A firm whose links enter Revere, or that switches arms, contributes nothing in the quarter it moves, so the roster growth visible in fig_A_firm_zero_vs_positive cannot move these lines. The 2017Q4 = 100 base is presentation only: it fixes where the lines cross 100, not who is compared with whom. Values are real 2020 USD before growth is taken. Pre-2009 zigzag = the odd-quarter reporting gap (many US funds filed semiannually), which also thins the matched counts in those quarters. Supersedes the frozen-2017Q4 cohort variant: a sweep over all 52 candidate freeze quarters left residual gaps from -19.5 to +18.4 index points (positive in 24 of 52), so no freeze-dependent residual is interpretable.
