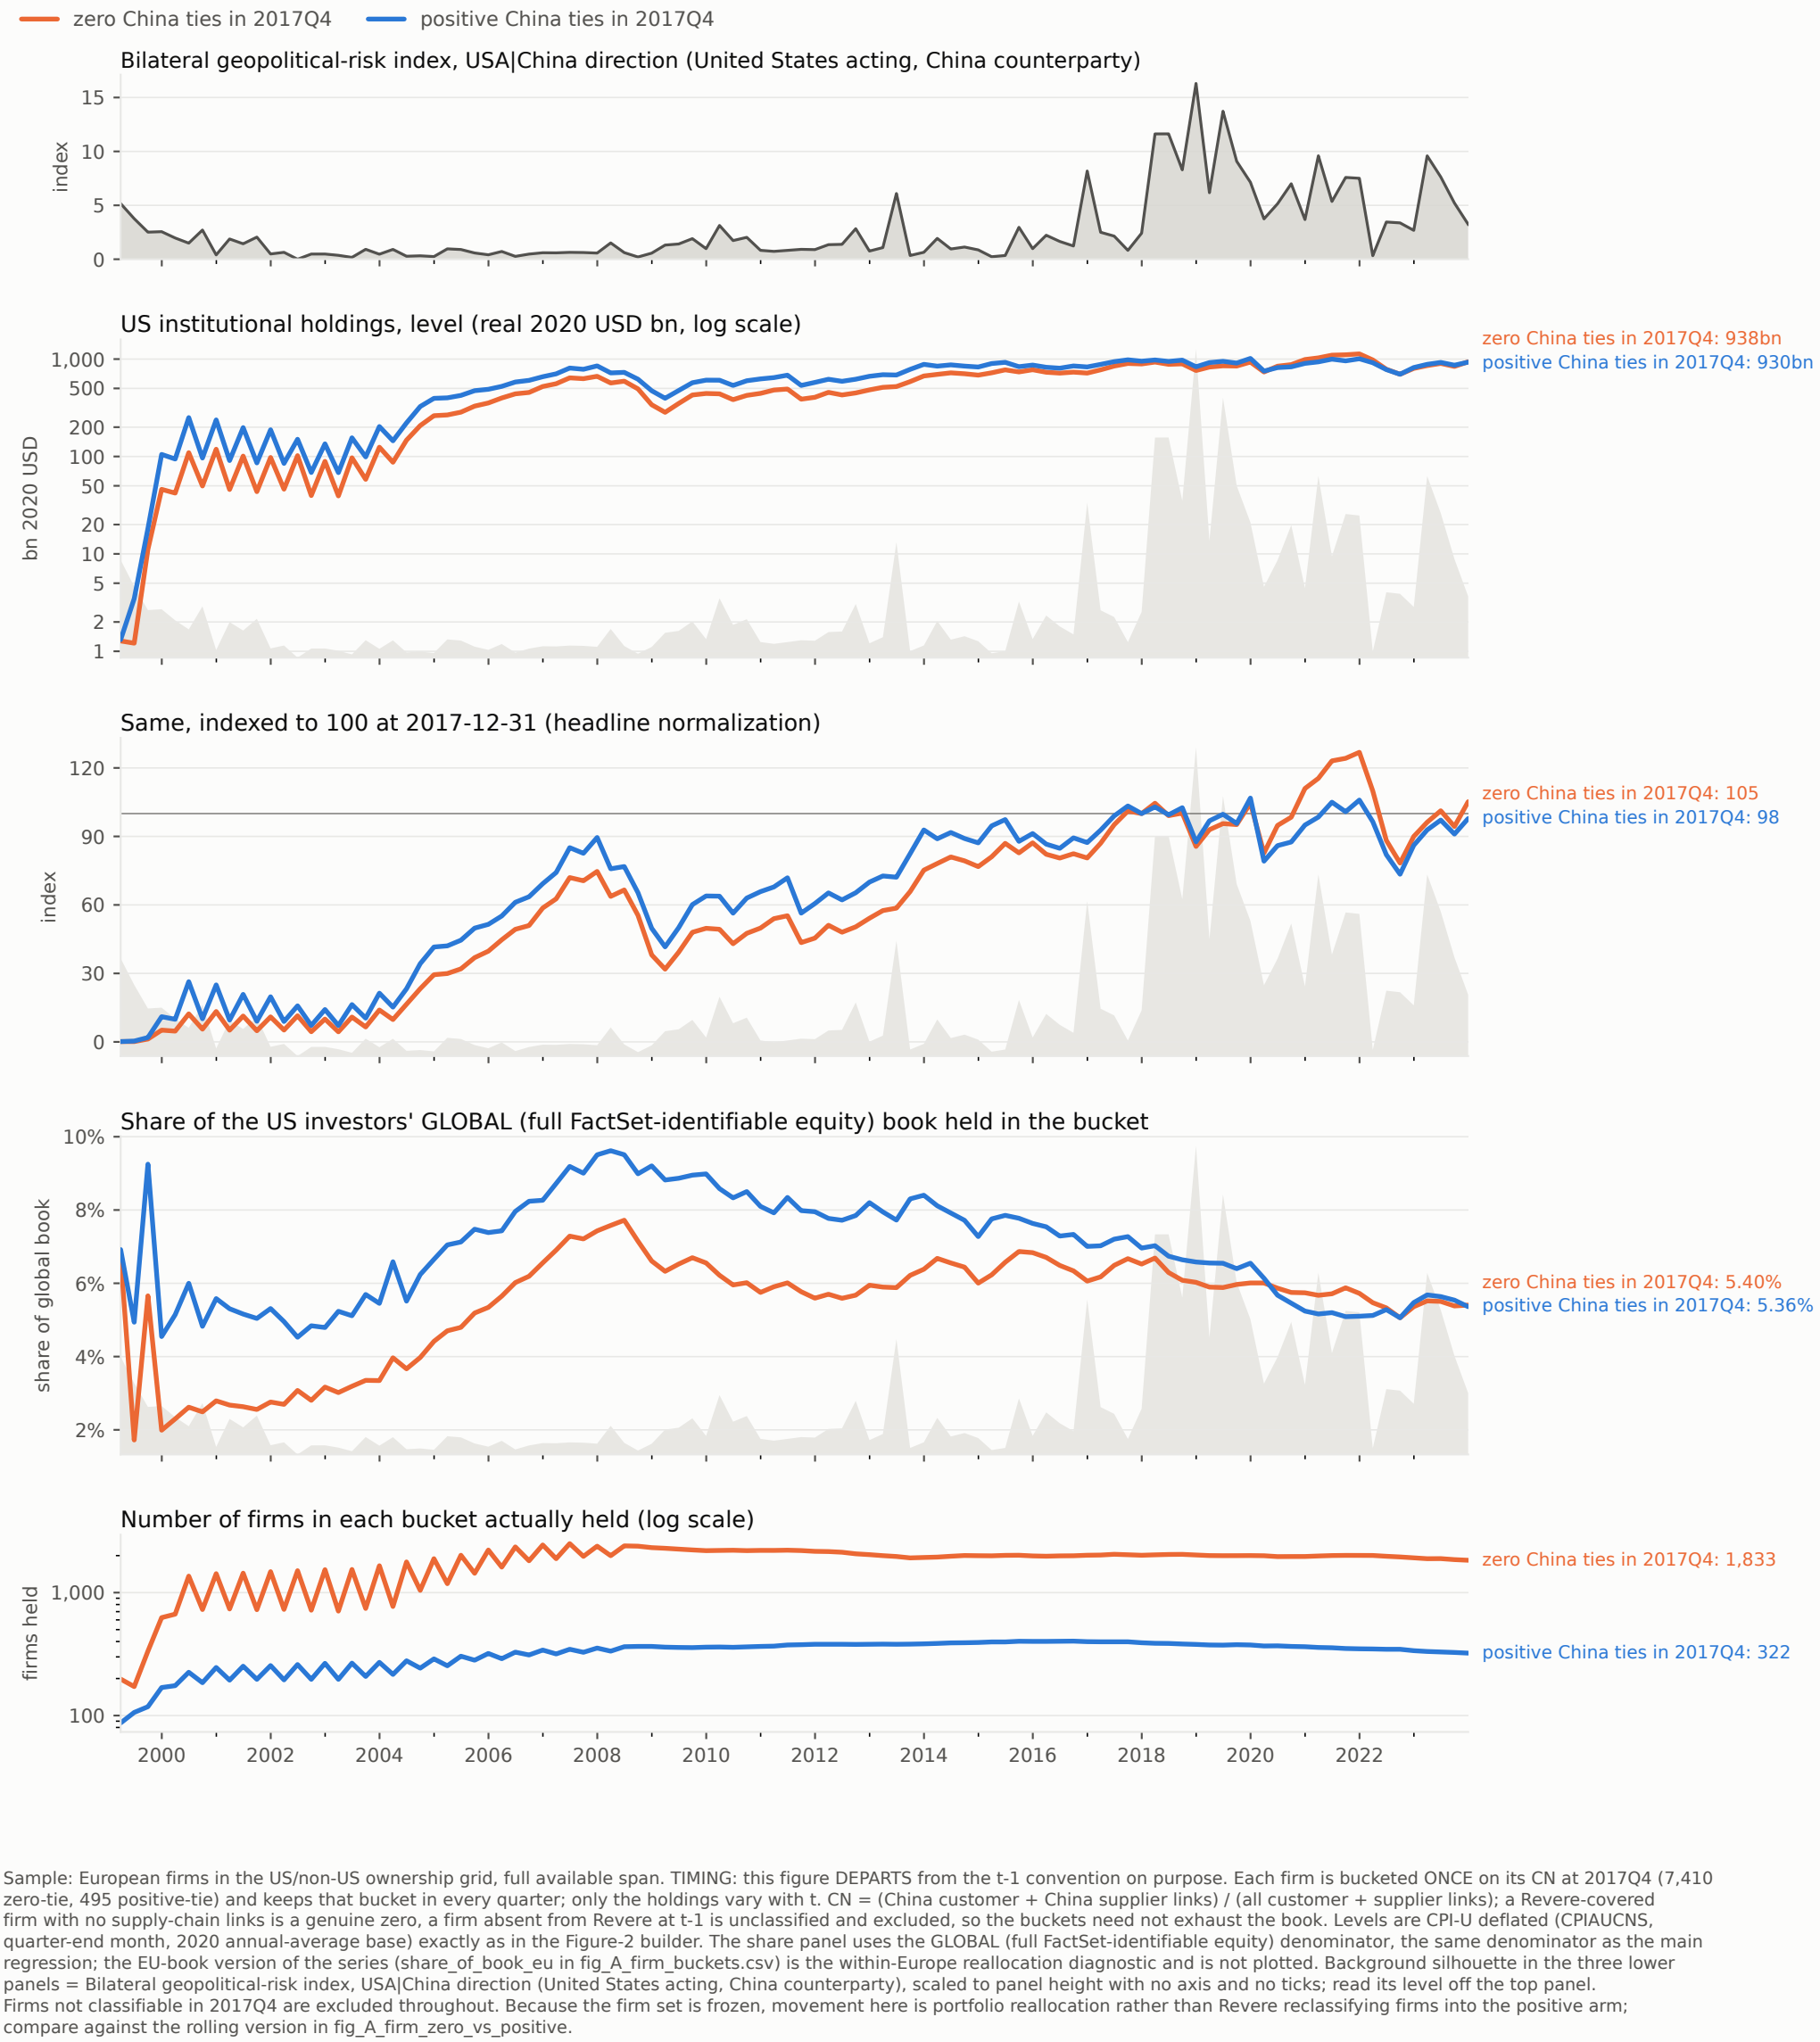
Figure A. US holdings of European firms, by China-link exposure

variant (i), composition control: membership frozen at 2017Q4



Sample: European firms in the US/non-US ownership grid, full available span. TIMING: this figure DEPARTS from the t-1 convention on purpose. Each firm is bucketed ONCE on its CN at 2017Q4 (7,410 zero-tie, 495 positive-tie) and keeps that bucket in every quarter; only the holdings vary with t. CN = (China customer + China supplier links) / (all customer + supplier links); a Revere-covered firm with no supply-chain links is a genuine zero, a firm absent from Revere at t-1 is unclassified and excluded, so the buckets need not exhaust the book. Levels are CPI-U deflated (CPIAUCNS, quarter-end month, 2020 annual-average base) exactly as in the Figure-2 builder. The share panel uses the GLOBAL (full FactSet-identifiable equity) denominator, the same denominator as the main regression; the EU-book version of the series (share_of_book_eu in fig_A_firm_buckets.csv) is the within-Europe reallocation diagnostic and is not plotted. Background silhouette in the three lower panels = Bilateral geopolitical-risk index, USA|China direction (United States acting, China counterparty), scaled to panel height with no axis and no ticks; read its level off the top panel. Firms not classifiable in 2017Q4 are excluded throughout. Because the firm set is frozen, movement here is portfolio reallocation rather than Revere reclassifying firms into the positive arm; compare against the rolling version in fig_A_firm_zero_vs_positive.
